EASA-PHONE®

Integrated Telephone System and Technical Guide

Telephone Equipment

KX-T2355

SPECIFICATIONS

Power Source:

Telephone line voltage

Battery; 4.5 V (Three "AA" Size Penlight Batteries) ... for TEL. NO. Memory

(Panasonic UM-3 or equivalent)

Memory Capacity:

28 telephone numbers, up to 16 digits for

each station

Dial Speed:

Tone (DTMF)/Pulse (10 pps)

Redial:

Last dialed telephone number up to 15 times in a 10 minute period

Pause:

Automatic Tone-Dial Detector

Speaker:

Unit; 6.5 cm (2.5") PM magnetic type

receiver unit, 32Ω

Handset; 3 cm (13/16") Ceramic type

receiver unit, 150Ω

Microphone: Dimensions: Electret condenser microphone

167 (W) × 70 (H) × 220 (D) mm

Weight:

 $(6^9/16 \times 2^3/4 \times 8^{21}/32")$

1 kg (2 b 3.2 oz) with batteries

Specifications are subject to change without notice.

Timing Chart of CPU

Circuit Operation:

- Pin 1~4 are the Hook SW, Tone/Pulse SW Data input Port.
- Pin 5 and 35~38 output the scanning signal to the Dial, Flash, Redial, Hold, Pause, Hook SW and Tone/Pulse SW.
- Pin 6 outputs the Hold and Speakerphone Signal.
 (High ··· Hold and Speakerphone OFF, Low ··· Hold and Speaker Phone ON)
- Pin 7 outputs the speakerphone/Handset Selector Signal.
 (High ··· Speakerphone, Low ··· Handset)
- Pin 8 outputs the signal for the battery backup when off-hook. During back up, its output is a Low level.
- Pin 11 inputs the EX-HOOK detect signal. When inputting the EX-HOOK detect signal, its input is a Low level.
- Pin 12 inputs the Tone detect signal. When inputting the Tone detect signal, its input is a Low level.
- Pin 13~14, 39~41 are output the scanning signal to the station-key, Lower, Mute MEMO key.
- Pin 15 outputs the speakerphone/Handset Selector Signal. (High ... Handset, Low ... Speakerphone.)
- Pin 16 is an output to control the Make/Break of the pulse. During Break, its output is a High level.
- Pin 17~20 are the muting control signals. During muting, its output is a high level.
- Pin 22 is the terminal for the audible tone signal output.
- Pin 23 and 24 output the Hold, and ON/OFF LED indicators. While the LED lights, the outputs, are at a low level.
- Pin 25 is the terminal for the D/A change and the DTMF signal output.
- Pin 26~29 are the key data input port.
- Pin 31 and 32 are the terminal to produce the system clock of CPU.
- Pin 33 inputs the reset signal to CPU. When reset its input is a low level.
- Pin 34 inputs the stand by signal to IC.When stand by, inputs low level.
- Pin 42 is the + power supply input of the CPU.

BLOCK DIALGRAM

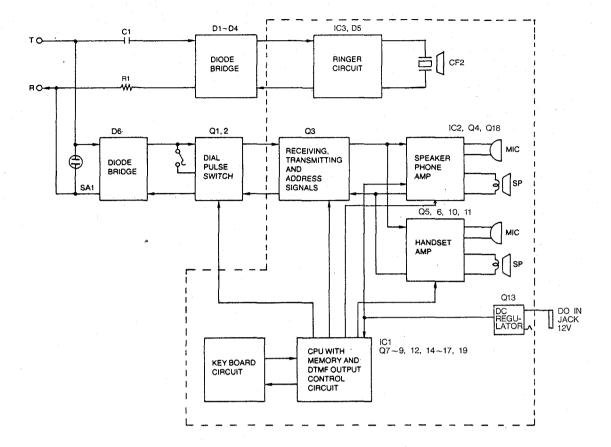

Fig. 7

CIRCUIT OPERATIONS

TELEPHONE LINE INTERFACE and PULSE DIAL CIRCUIT

When the hook switch SW1 is ON (off-hook), the circuit is closed, and current is supplied to the base of Q2 via the diode bridge $D6 \sim 9$ and Q2 is $On \rightarrow Q1$ is ON (OFF-HOOK condition).

If port Pin 8 is LOW→ Q8 is OFF→ Q2 is ON→ Q1 is ON. (make)

Circuit Diagram ... See page 7

RINGER CIRCUIT

Circuit Operation:

The bell signal passes through C1 (R1)→ diode bridge, supplying power to pin 1 of IC2.

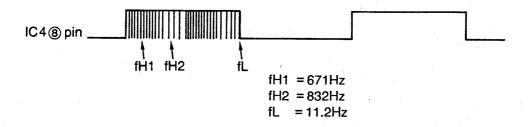

The ring signal is outputted from Pin 8 of IC2, and its volume is adjusted in adjusted in 3 steps (H-L-OFF) by SW4 then impressed on the ceramic sound generator, and so is generated.

| R2 | Bell sensitivity adjustment |
|--------|---------------------------------|
| R4, C4 | Bell frequency setting fH1, fH2 |
| R3, C3 | Repeat frequency setting fL |

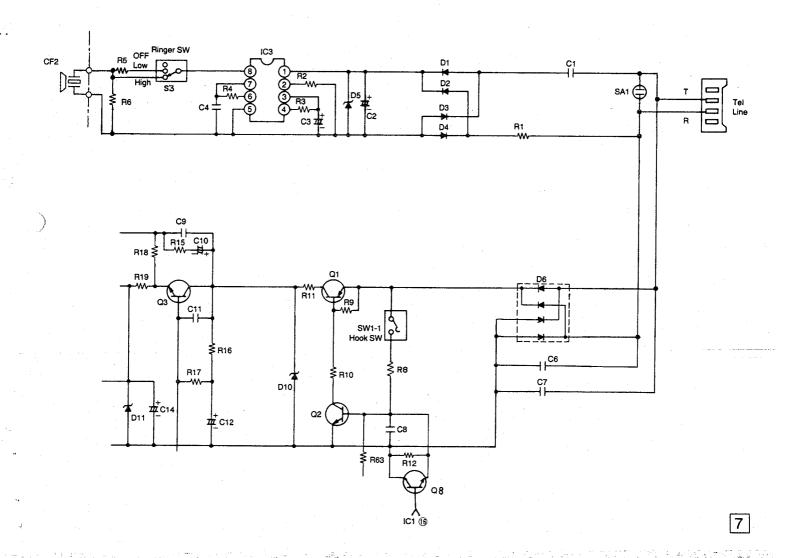

fH1, fH2, fL are derived from the following formulas:

The following shows the waveform of the tone ringing IC output:

The following shows the waveform of the tone ringing IC output:

Circuit Diagram

TONE DIAL CIRCUIT

Function:

The tone dialing circuit consists of a DTMF (Dual Tone Multi Frequency) signal generator (outputted from Pin 25 of the microprocessor) for tone dialing, and also a circuit for outputting the signal to the line.

The DTMF circuit identifies inputs from the 12 keys (1,2,3,4,5,6,7,8,9,0,\footnote{\pmax} and #) by means of a total of seven frequencies, that is four low frequencies (Low group) and three high frequencies (High group).

Circuit Description:

When a dial key is pressed, a DTMF signal is outputted from Pin 25 of IC1 as an analog synthetic wave.

The signal flow to the line is as follows.

Pin 25 of IC1→R62, C45→ Q10 base→ Q10 collector→ C44, R53→ Q3 base→ Q3 collector→ R11→ Q1 collector→ Q1 emitter→ Diode bridge (D6)→ TEL. Line.

The DTMF signal is sent to the line via the following path.

Q10 amplifies the DTMF signal.

Q3 is an amplifier which is used to output the signal to line.

Shown below is the signal flow used to output the DTMF signal from the handset as a monitor tone when a dial key is pressed.

Pin 25 of IC1→ R30, C18, C35→ Q6 base→ Q6 emitter→ C49→ Handset Speaker.

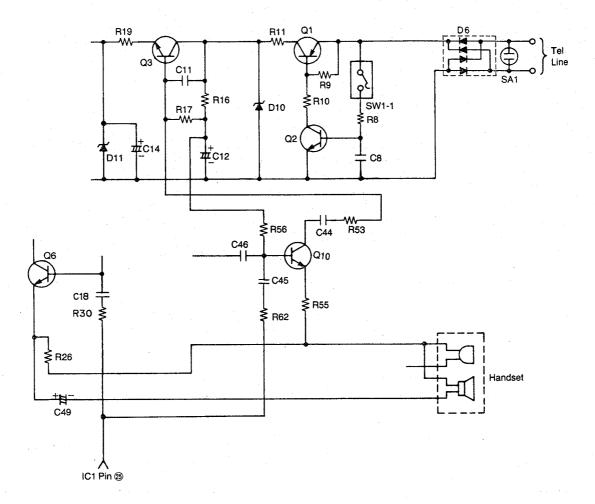

The signal combination and frequency corresponding to each dial key is shown below.

High Group H₁ H₂ НЗ Low Group 2 L1 3 4 5 6 L2 9 L3 7 8 L4 0 X

Tone Frequencies

| Low Group | Frequencies | High Group | Frequencies |
|-----------|------------------|------------|-------------------|
| L1 | 697 Hz ± 1.5% | H1 | 1209 Hz ± 1.5% |
| L2 | 770 Hz ± 1.5% | H2 | 1336 Hz ± 1.5% |
| L3 | 852 Hz ± 1.5% | НЗ | 1477 Hz ± 1.5% |
| L4 | 941 Hz ± 1.5% | | |

Circuit Diagram

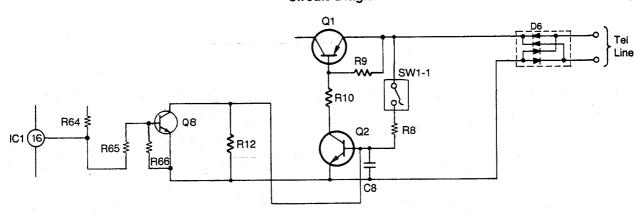

PULSE DIAL CIRCUIT

Circuit Operation:

The dial pulses are generated by the CPU (IC1), and reach the telephone line via the following path; Pin 16 of IC1 \rightarrow R65 \rightarrow Q8 \rightarrow Q2 \rightarrow Q1 \rightarrow Telephone Line.

Circuit Diagram

SPEAKERPHONE CIRCUIT

Function:

This circuit controls the automatic switching of the transmitted and received signals, to and from the telephone line, when the unit is used in the hands-free mode.

Circuit Operation:

The Speakerphone can only provide a one-way communication path.

In other words, it can either transmit an outgoing signal or receive an incoming signal at a given time, but cannot do both simultaneously. Therefore, a switching circuit is necessary to control the flow of the outgoing and incoming signals. This switching circuit is contained in IC2 and consists of a Voice Detector, Tx Attenuator, Rx Attenuator, Comparator and Attenuator Control. The circuit analyzes whether the Tx (transmit) or the Rx (receive) signal is louder, and then it processes the signals such that the louder signal is given precedence.

The Voice Detector provides a DC input to the Attenuator Control corresponding to the Tx signal.

The Comparator receives a Tx and a Rx signal, and supplies a DC input to the Attenuator Control corresponding to the Rx signal. The Attenuator Control provides a control signal to the Tx and the Rx Attenuator to switch the appropriate signals on and off. The Attenuator Control also detects the level of the volume control to automatically adjust for changing ambient conditions.

1) Transmission Signal Path

The input signal from the microphone is sent through the circuit via the following path:

Mic→ Pin 9 of IC2→ Pin 10 of IC2→ Pin 3 of IC2→ Pin 4 of IC2→ Interface (Q3)→ Telephone Line.

2) Reception Signal Path

Signals received from the telephone line are outputted at the speaker via the following path:

Telephone Line→Interface (Q3)→receive amp (Q18)→Pin 27 of IC2→Pin 26 of IC2→Pin 19 of IC2→Pin 15 of IC2→Speaker.

3) Control Signal Path

Control signals for transmission and reception are inputted to IC2 via the following path:

(Transmission Control Signal Path)

Mic→Pin 9 of IC2→Pin 10 of IC2→Pin 3 of IC2→Pin 4 of IC2→Pin 5 of IC2.

(Reception Control Signal Path)

Telephone Line→Interface (Q3)→Receive Amp (Q18)→Pin 7 of IC2.

4) Transmission/Reception Switching

The comparison result between Rx and Rx outputs as a DC level of IC2 pin 25.

Tx level is high Pin 25 = Pin 20—6 mV

Rx level is high Pin 25 = Pin 20—150 mV

Comparator output is connected to the attenuator control inside of IC2.

5) Voice Detector

The output of the mic amp (Pin 10 of IC2) is supplied to Pin 13 of IC2 as a control signal for the voice detector.

6) Attenuator Control

The attenuator control detects the setting of the volume control through Pin 24 of IC2 to automatically adjust for changing ambient conditions.

Circuit Diagram

RESET CIRCUIT

Functions:

The reset circuit is a detection circuit which is used to detect the power supply voltage and apply a reset to the microprocessor (IC1) when the circuit changes from an ON status to an OFF-HOOK status.

Circuit Operation:

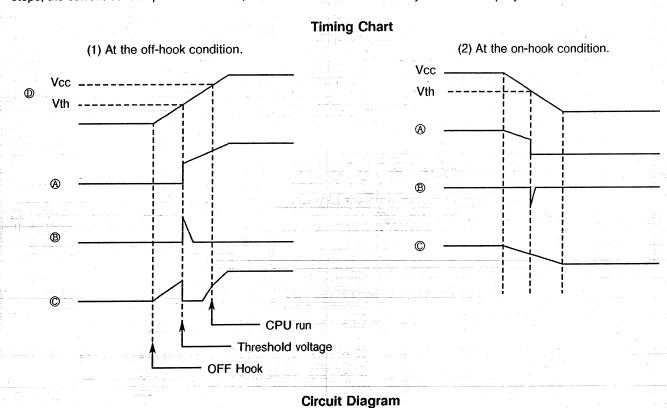

When the set is changed from an ON HOOK to an OFF HOOK status:

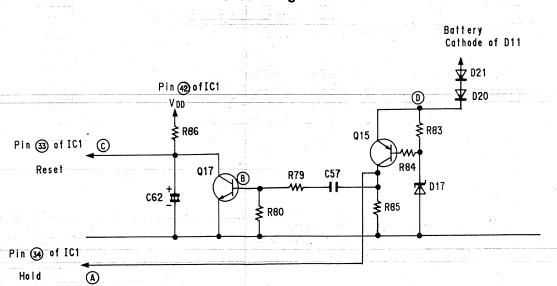

(The timing chart is indicated by points (A), (B), (C), and (D).)

The set is OFF HOOK, and the voltage at point (D) rises until it reaches the rest voltage level, Vth, then D19 goes ON→ Q15 goes ON→ Q17 goes ON→ point@momentarily becomes LOW level, causing a reset to be applied to the microprocessor (IC1).

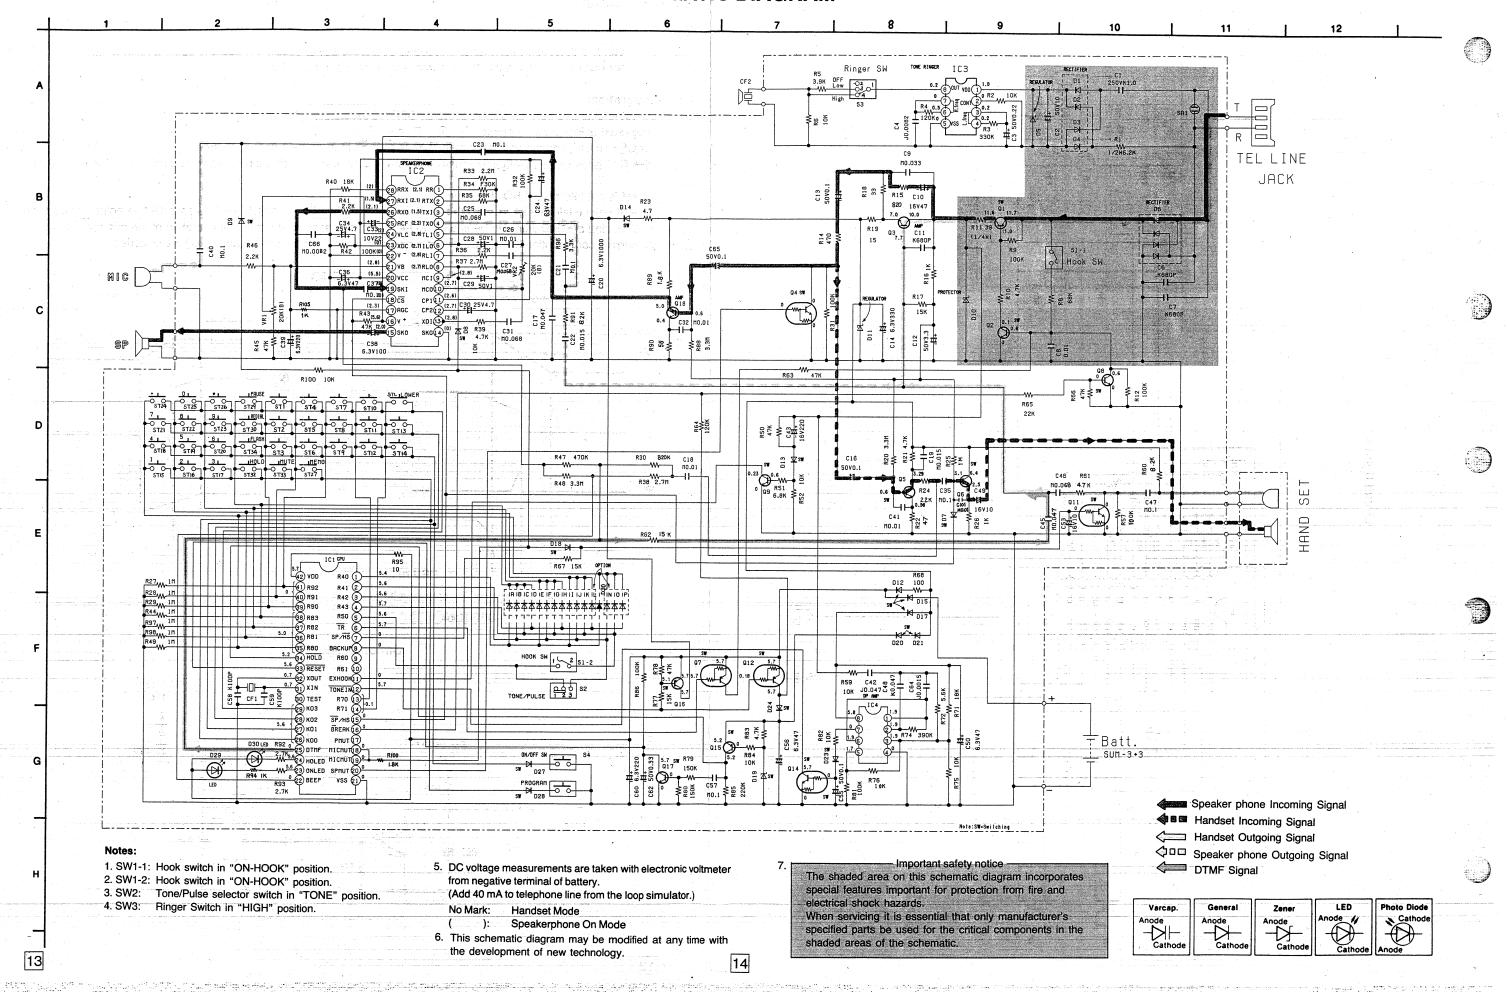

When the set is put into an ON HOOK status:

The voltage at point o falls until it reaches the reset voltage Vth, then D19 goes OFF→ Q15 goes OFF→ point (A) becomes LOW level, causing a HOLD signal to be applied to the microprocessor. As a result, the operation of the microprocessor stops, the current consumption is reduced, and the contents of the memory are backed up by the batteries.

TONE DETECTION CIRCUIT

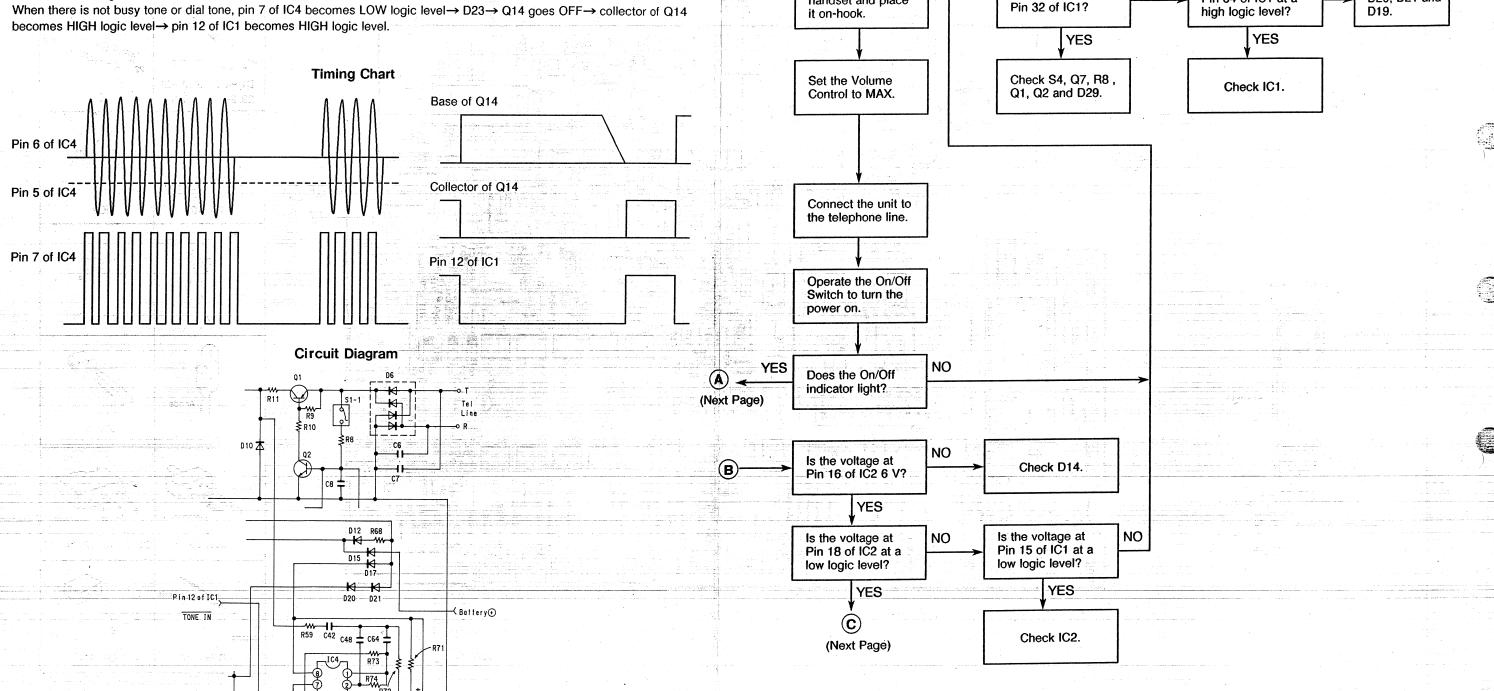

Function:

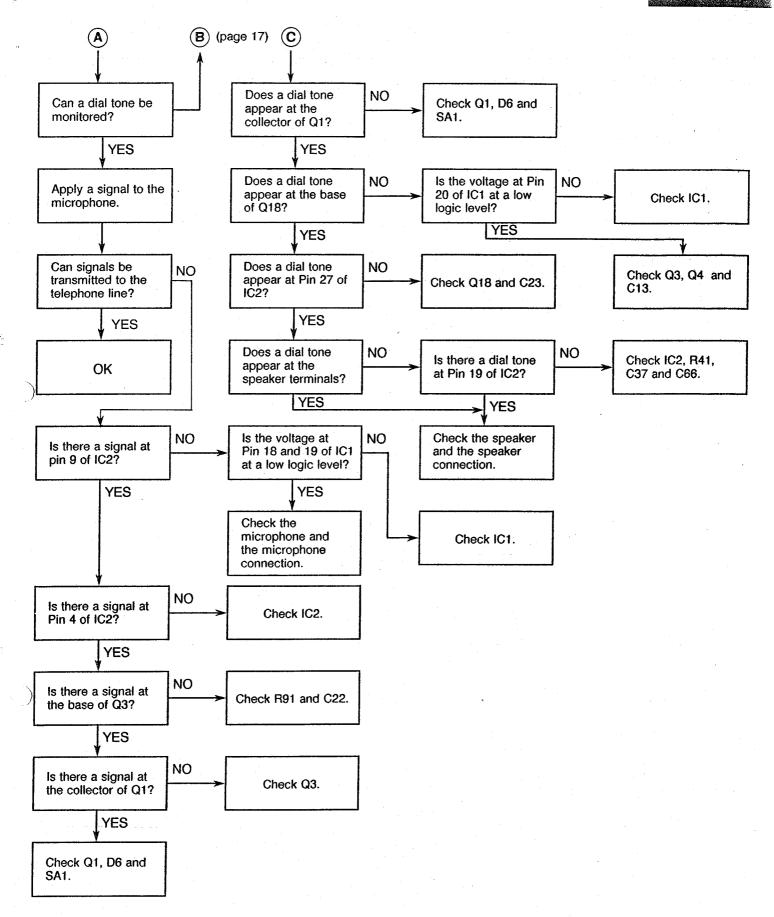

This circuit is used to sense the status of the line (busy tone or dial tone) during Auto PAUSE or Auto Redial.

Circuit Description:

The signal from the line passes through the path D6 \rightarrow Q1 \rightarrow R11 \rightarrow R59 \rightarrow C42 \rightarrow C48, and is then input to pin 2 of IC4. Here the dial tone or busy tone alone is extracted and output from pin 1 of IC4. It is then input to pin 6 of IC4 and compared with the level at pin 5 of IC4. When a busy tone or dial tone is input, pin 7 of IC4 becomes HIGH logic level. This level passes through D15, and is smoothed by C55→ Q14 goes ON→ collector of Q14 becomes LOW logic level→ pin 12 of IC1 becomes LOW logic level.

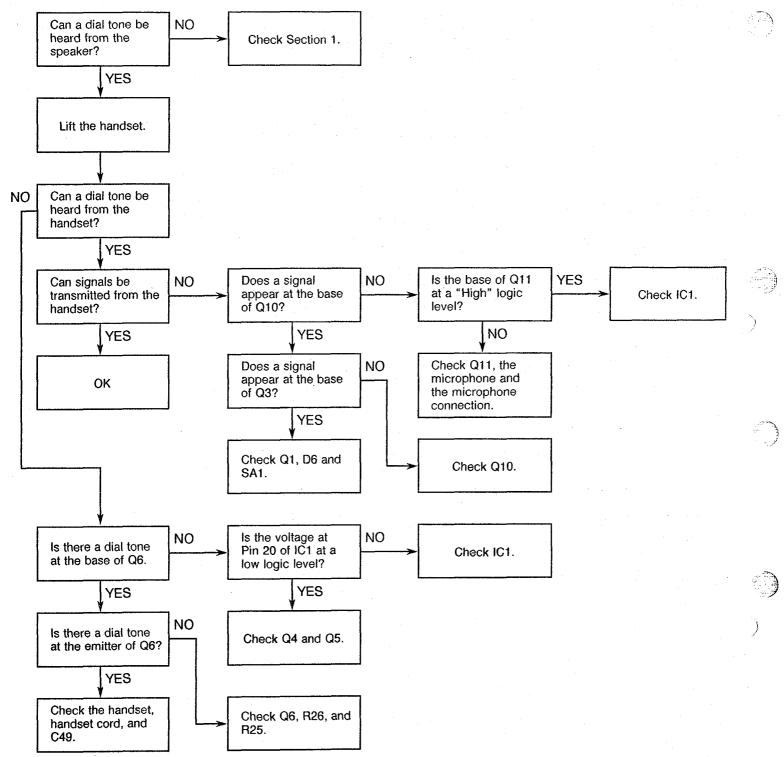

When there is not busy tone or dial tone, pin 7 of IC4 becomes LOW logic level→ D23→ Q14 goes OFF→ collector of Q14

ADJUSTMENT

Perform the following adjustment after replacing IC2 and VR2.

Test Equipment:

Loop Simulator RC Oscillator VTVM

Preparation:

- 1. Set the unit's controls as follows:
 - A. SP-PHONE SWITCH-"ON"
 - B. VOLUME CONTROL-"MAX"
- 2. Connect Test Points V-V.
- 3. Set the variable resistor of the loop simulator to maximum resistance (fully counterclockwise).
- 4. Connect the unit to the loop simulator.
- 5. Make adjustment in a quiet room.
- 6. After adjustment are made, disconnect Test Points V-V

Transmission Level:

- 1. Set the loop simulator selector switch to "TX".
- Connect the RC Oscillator to Test Point ▼(-)-▼(+), and connect an electrolytic capacitor (50 V, 1 μF) as shown below.
- 3. Set RC Oscillator to 1 kHz, -56 dBm.

- 4. Connect the VTVM to Test Points ♥ (-) ♥ (+).
- 5. Adjust VR2 for a reading of $-23~\text{dBm}~\pm 0.5~\text{dB}$ on the VTVM.

Please refer to Circuit Board and wiring Connection Diagram which is located test points (▼).

Matsushita Services Company Division of Matsushita Electric Corporation of America 50 Meadowiand Parkway, Secaucus, New Jersey 07094 Matsushita Electric of Canada Limited 5770 Ambler Drive, Mississauga, Ontario, L4W 2T3 Panasonic Sales Company, Division of Matsushita Electric of Puerto Rico, Inc. San Gabriel Industrial Park 65th Infantry Ave. Km.9.5 Carolina, Puerto Rico 00630

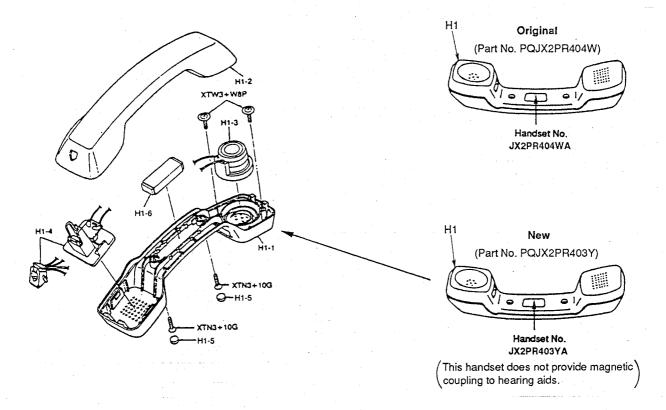

Notes

1. Parts of *1 marks has been changed at the same time. (Change of handset...Production of Aug. 1988 ~ Jun. 1989.)

2. Parts of *2 marks has been changed at the same time.

M HANDSET PARTS LOCATION

Notes:

- 1) We intend to supply replacement handset (PQJX2PR403Y) after the extinction of PQJX2PR404W stock, because the handset (PQJX2PR404W) can not be produced.
- 2) When replacing the handset assembly (H1) from PQJX2PR404W to PQJX2PR403Y, replace the resistors (R22, R34, R88, R89 and R90) from original parts to new parts and capacitors (C17, C19, C32, C35, C53 and C65) from original parts to new parts, and remove the Q18, D8 at the same time.

Product:

Telephone

င်ymptom:

Dead receiver (ear piece) on handset.

Cause:

- A) The strength of the glue to which the Hearing-Aid coil is mounted weakens and detaches when the handset is subjected to abnormal shocks, such as dropping from high places or vibration.
- B) The soldering period (heat applied) to the coil lead and the terminal was too long. Due to this, the coil lead (soldering position) becomes thin and breaks when dropped or vibrated.

Remedy:

Replace the handset ear piece with a new improved Part Number PQAX4P03Y.

NOTE:

FOR FUTURE PRODUCTION THE FACTORY WILL USE THE NEW IMPROVED EAR PIECE. THE IMPROVED EAR PIECE WILL HAVE A STAMPED FOUR DIGIT NUMBER GREATER THAN 9025.

THIS SERVICE BULLETIN APPLIES TO ALL HANDSET FOR CONSUMER AND BUSINESS MODEL PHONES THAT ARE HEARING-AID COMPATIBLE, WITH HANDSET PART NUMBER POJX2P Z
